From Scanbody to Implant Supported Crown: No Impressions

Scanbody

Screw-retained final crown

Now we are back at work our focus has shifted to how we can minimize the patient's time spent in the office. Intraoral scanners have revolutionized the way we practice dentistry. Digital Impressions only take minutes, without the need for the uncomfortable experience and mess of physical impressions. More importantly they produce a highly accurate 3D representation of the mouth reducing the likelihood of remakes and corrections – meaning no additional appointments. In the case below the Scanbody allows us to produce a custom, digitally designed Atlantis abutment and fitted crown following a fully digital workflow for the perfect result.
